# **Chapitre 1**

# Document presentation

# 1.1 Document objectives

This document presents the detailed specifications of the Vishnu C++ API.

These specifications include the definition of all methods and all data types provided by the API.

# 1.2 Document structure

The document is divided into 4 parts corresponding to the 4 modules that compose the Vishnu system:

- UMS: Users Management System
- TMS: Tasks Management System
- FMS: Files Management System
- IMS : Information Management System

Each module corresponds to a chapter in the document, and each chapter contains the following sections :

- A first section describing the definition of all methods provided by the library
- A second section describing the definition of all data types provided by the library
- TODO A third section describing the dependencies of the library

#### 1.3 References

TODO - ajouter ref. vers les specs générales

# 1.4 Glossary

# **Chapitre 2**

# API specification for User Management System (UMS)

# 2.1 Definition of the functions of the API

# 2.1.1 connect

#### **Parameters**

| Parameter  | Type           | Description   | Mode | Required |
|------------|----------------|---|------|----------|
| login      | string         | login represents the login of the user  | IN   | yes      |
| password   | string         | password represents the password of the user  | IN   | yes      |
| options    | ConnectOptions | options is an object which encapsulates the options available for the connect method. It allows the user to choose the way for closing the session automatically on TIMEOUT or on DISCONNECT and the possibility for an admin to open a session as he/she was a specific user | IN   | no       |
| sessionKey | string         | The sessionKey is the identifier of the session generated by VISHNU   | OUT  | yes      |

#### **Description**

The connect() function allows the user to open a session

#### **Return Value**

| Name                     | Description  |
|--------------------------|--|
| VISHNU_OK                | The command completed successfully                             |
| NOT_AUTHENTICATED        | Unknown user   |
| UNKNOWN_CLOSURE_MODE     | The name of the closure mode is unknown                        |
| INCORRECT_TIMEOUT        | The value of the timeout is incorrect (negative or higher than |
| INCORRECT_TIMEOUT        | the TIMEOUT treshold)  |
| UNKNOWN_LOGIN            | The login is unknown   |
| NO_ADMIN                 | The user is not an administrator                               |
| INCORRECT_PASSSWORD_SIZE | The size of the password is incorrect                          |
| INCORRECT_LOGIN_SIZE     | The size of the login is incorrect                             |
| DB_ERROR                 | A problem occurs with the database                             |
| UMS_SERVER_NOT_AVAILABLE | The server UMS is not available                                |

int **connect**(const string& login, const string& password, const ConnectOptions& options=ConnectOptions(), string& session-Key);

#### 2.1.2 reconnect

#### **Parameters**

| Parameter  | Type   | Description   | Mode | Required |
|------------|--------|---|------|----------|
| login      | string | login represents the login of the user                              | IN   | yes      |
| password   | string | password represents the password of the user                        | IN   | yes      |
| sessionId  | string | sessionId is the identifier of the session defined in the database  | IN   | yes      |
| sessionKey | string | The sessionKey is the identifier of the session generated by VISHNU | OUT  | yes      |

#### Description

The reconnect() function allows the user to get the session Key of a session in which he/she was disconnected previously without closing it

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name                     | Description  |  |  |
|--------------------------|--|--|--|
| VISHNU_OK                | The command completed successfully                             |  |  |
| NOT_AUTHENTICATED        | Unknown user   |  |  |
| INCORRECT_LOGIN_SIZE     | The size of the login is incorrect                             |  |  |
| INCORRECT_PASSSWORD_SIZE | The size of the password is incorrect                          |  |  |
| SESSION INCOMPATIBILITY  | This session identifier is incompatible with the authenticated |  |  |
| SESSION_INCOMPATIBILITY  | user   |  |  |
| UNKNOWN_SESSION_ID       | The session Id is unknown                                      |  |  |
| SESSIONKEY_EXPIRED       | The sessionKey is expired. The session is closed.              |  |  |
| SESSIONKEY_NOT_FOUND     | The sessionKey is unregonized                                  |  |  |
| DB_ERROR                 | A problem occurs with the database                             |  |  |
| UMS_SERVER_NOT_AVAILABLE | The server UMS is not available                                |  |  |

#### **Signature**

int reconnect(const string& login, const string& password, const string& sessionId, string& sessionKey);

# 2.1.3 createUser

#### **Parameters**

| Parameter  | Type   | Description   | Mode | Required |
|------------|--------|---|------|----------|
| sessionKey | string | The sessionKey is the identifier of the session generated by VISHNU | IN   | yes      |
| newUser    | User   | newUser is an object which encapsulates the new user information    | IN   | yes      |

#### **Description**

The createUser() function adds a new user in VISHNU

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name                     | Description                                       |
|--------------------------|---|
| VISHNU_OK                | The command completed successfully                |
| NO_ADMIN                 | The user is not an administrator                  |
| INCORRECT_LOGIN_SIZE     | The size of the login is incorrect                |
| INCORRECT_PASSSWORD_SIZE | The size of the password is incorrect             |
| SESSIONKEY_NOT_FOUND     | The sessionKey is unregonized                     |
| SESSIONKEY_EXPIRED       | The sessionKey is expired. The session is closed. |
| LOGIN_EXISTING           | The login already exists in the database          |
| INVALID_MAIL_ADRESS      | The mail adress is invalId                        |
| USERID_REQUIRED          | The userId must to be defined                     |
| DB_ERROR                 | A problem occurs with the database                |
| UMS_SERVER_NOT_AVAILABLE | The server UMS is not available                   |

#### Signature

int createUser(const string& sessionKey, const User& newUser);

# 2.1.4 updateUser

#### **Parameters**

| Parameter  | Type              | Description   | Mode | Required |
|------------|-------------------|---|------|----------|
| sessionKey | string            | The sessionKey is the identifier of the session generated by VISHNU | IN   | yes      |
| options    | UpdateUserOptions | options is an object which encapsulates user information updated    | IN   | no       |

# Description

The updateUser() function updates the user information in VISHNU except login and password

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name                     | Description                                       |
|--------------------------|---|
| VISHNU_OK                | The command completed successfully                |
| NO_ADMIN                 | The user is not an administrator                  |
| UNKNOWN_LOGIN            | The login is unknown                              |
| INVALID_MAIL_ADRESS      | The mail adress is invalId                        |
| SESSIONKEY_NOT_FOUND     | The sessionKey is unregonized                     |
| SESSIONKEY_EXPIRED       | The sessionKey is expired. The session is closed. |
| INCORRECT_LOGIN_SIZE     | The size of the login is incorrect                |
| INCORRECT_PASSSWORD_SIZE | The size of the password is incorrect             |
| DB_ERROR                 | A problem occurs with the database                |
| UMS_SERVER_NOT_AVAILABLE | The server UMS is not available                   |

#### **Signature**

 $int \ \textbf{updateUser} (const \ string \& \ session Key, \ const \ UpdateUser Options \& \ options = UpdateUser Options()) \ ;$ 

#### 2.1.5 deleteUser

#### **Parameters**

| Parameter  | Type   | Description  | Mode | Required |
|------------|--------|--|------|----------|
| login      | string | login represents the login of the user which will be deleted from VISHNU | IN   | yes      |
| sessionKey | string | The sessionKey is the identifier of the session generated by VISHNU      | IN   | yes      |

# Description

The deleteUser() function removes a user from VISHNU

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name                     | <b>Description</b>                                |
|--------------------------|---|
| VISHNU_OK                | The command completed successfully                |
| UNKNOWN_LOGIN            | The login is unknown                              |
| NO_ADMIN                 | The user is not an administrator                  |
| INCORRECT_LOGIN_SIZE     | The size of the login is incorrect                |
| SESSIONKEY_NOT_FOUND     | The sessionKey is unregonized                     |
| SESSIONKEY_EXPIRED       | The sessionKey is expired. The session is closed. |
| DB_ERROR                 | A problem occurs with the database                |
| UMS_SERVER_NOT_AVAILABLE | The server UMS is not available                   |

#### Signature

int **deleteUser**(const string& login, const string& sessionKey);

#### 2.1.6 close

#### **Parameters**

| Parameter  | Type   | Description   | Mo <mark>de</mark> | Required |
|------------|--------|---|--------------------|----------|
| sessionKey | string | The sessionKey is the identifier of the session generated by VISHNU | IN                 | yes      |

#### **Description**

The close() function allows a user to close a session

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name                 | Description                                       |
|----------------------|---|
| VISHNU_OK            | The command completed successfully                |

# Signature

int close(const string& sessionKey);

# 2.1.7 changePassword

#### **Parameters**

| Parameter   | Type   | Description   | Mode | Required |
|-------------|--------|---|------|----------|
| login       | string | login represents the login of the user              | IN   | yes      |
| password    | string | password represents the password of the user        | IN   | yes      |
| passwordNew | string | passwordNew represents the new password of the user | IN   | yes      |

#### **Description**

The changePassword() function allows the user to change his/her password

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name                     | Description                           |
|--------------------------|---------------------------------------|
| VISHNU_OK                | The command completed successfully    |
| NOT_AUTHENTICATED        | Unknown user                          |
| INCORRECT_LOGIN_SIZE     | The size of the login is incorrect    |
| INCORRECT_PASSSWORD_SIZE | The size of the password is incorrect |
| DB_ERROR                 | A problem occurs with the database    |
| UMS_SERVER_NOT_AVAILABLE | The server UMS is not available       |

# Signature

int **changePassword**(const string& login, const string& password, const string& passwordNew);

# 2.1.8 resetPassword

#### **Parameters**

| Parameter     | Type   | Description   | Mode | Required |
|---------------|--------|---|------|----------|
| login         | string | login represents the login of the user                              | IN   | yes      |
| passwordReset | string | passwordReset represents the new value of the password to be reset  | IN   | yes      |
| sessionKey    | string | The sessionKey is the identifier of the session generated by VISHNU | IN   | yes      |

#### **Description**

The resetPassword() function allows an admin to reset the password of a user identified by his/her userId

#### **Return Value**

| Name                     | Description                                       |
|--------------------------|---|
| VISHNU_OK                | The command completed successfully                |
| NO_ADMIN                 | The user is not an administrator                  |

#### **Signature**

int createLocalAccount(const string& sessionKey, const LocalAccount& newAccount);

# 2.1.10 updateLocalAccount

#### **Parameters**

| Parameter  | Type         | Description  | Mode | Required |
|------------|--------------|--|------|----------|
| options    | LocalAccount | options is an object which encapsulates the change of the local user configuration except the machineId and the userId | IN   | no       |
| sessionKey | string       | The sessionKey is the identifier of the session generated by VISHNU  | IN   | yes      |

#### Description

The updateLocalAccount() function allows the user to update his/her local user configuration in VISHNU

#### **Return Value**

| Name                     | <b>Description</b>  |  |
|--------------------------|---|--|
| UNKNOWN_LOGIN            | The login is unknown  |  |
| UNKNOWN_MACHINE          | The machineId is unknown  |  |
| SESSIONKEY_NOT_FOUND     | The sessionKey is unregonized                                   |  |
| SESSIONKEY_EXPIRED       | The sessionKey is expired. The session is closed.               |  |
| UNKNOWN LOCAL ACCOUNT    | The local configuration for the given user on the given machine |  |
| UNKNOWN_LOCAL_ACCOUNT    | is unknown  |  |
| DB_ERROR                 | A problem occurs with the database                              |  |
| UMS_SERVER_NOT_AVAILABLE | The server UMS is not available                                 |  |

int updateLocalAccount(const LocalAccount& options, const string& sessionKey);

#### 2.1.11 deleteLocalAccount

#### **Parameters**

| Parameter  | Type   | Description   | Mode | Required |
|------------|--------|---|------|----------|
| userId     | string | userId represents the login of the user which will be deleted according to a specific machine         | IN   | yes      |
| machineId  | string | machineId represents the identifier of the machine which will be deleted according to a specific user | IN   | yes      |
| sessionKey | string | The sessionKey is the identifier of the session generated by VISHNU                                   | IN   | yes      |

#### **Description**

The deleteLocalAccount() function allows to remove a local user configuration from VISHNU for a given user on a given machine

## **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name                     | <b>Description</b>  |
|--------------------------|---|
| VISHNU_OK                | The command completed successfully                              |
| UNKNOWN_LOCAL_ACCOUNT    | The local configuration for the given user on the given machine |
| UNKNOWN_LOCAL_ACCOUNT    | is unknown  |
| SESSIONKEY_NOT_FOUND     | The sessionKey is unregonized                                   |
| SESSIONKEY_EXPIRED       | The sessionKey is expired. The session is closed.               |
| DB_ERROR                 | A problem occurs with the database                              |
| UMS_SERVER_NOT_AVAILABLE | The server UMS is not available                                 |

#### **Signature**

int deleteLocalAccount(const string& userId, const string& machineId, const string& sessionKey);

# 2.1.12 saveConfiguration

| Parameter     | Type          | Description   | Mode | Required |
|---------------|---------------|---|------|----------|
| sessionKey    | string        | The sessionKey is the identifier of the session generated by VISHNU             | IN   | yes      |
| configuration | Configuration | The configuration is an object which encapsulates the configuration description | OUT  | yes      |

The saveConfiguration() function allows an admin to save the configuration of VISHNU

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name                     | <b>Description</b>                               |

#### **Parameters**

| Parameter    | Type      | Description   | Mode | Required |
|--------------|-----------|---|------|----------|
| sessionKey   | string    | The sessionKey is the identifier of the session generated by VISHNU | IN   | yes      |
| userIdOption | string    | allows an admin to list one user identified by his/her userId       | IN   | no       |
| listuser     | ListUsers | listuser is the list of users                                       | OUT  | yes      |

# Description

The listUsers() function allows the user to get an object which encapsulates the list of all users objects of VIHSNU

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name                     | Description                                       |
|--------------------------|---|
| NO_ADMIN                 | The user is not an administrator                  |
| UNKNOWN_LOGIN            | The login is unknown                              |
| SESSIONKEY_EXPIRED       | The sessionKey is expired. The session is closed. |
| SESSIONKEY_NOT_FOUND     | The sessionKey is unregonized                     |
| INCORRECT_DATE_OPTION    | The date option is incorrect                      |
| DB_ERROR                 | A problem occurs with the database                |
| UMS_SERVER_NOT_AVAILABLE | The server UMS is not available                   |

#### **Signature**

int listUsers(const string& sessionKey, const string& userIdOption, ListUsers& listuser);

#### 2.1.21 listSessions

#### **Parameters**

| Parameter   | Туре               | Description  | Mode | Required |
|-------------|--------------------|--|------|----------|
| sessionKey  | string             | The sessionKey is the identifier of the session generated by VISHNU  | IN   | yes      |
| options     | ListSessionOptions | allows the user to list sessions using several optional criteria such as: the state of sessions (all, inactives or inactives, by default, only actives sessions are listed), a period, a specific session or for admin to list all sessions of all users or sessions of a specific user. | IN   | no       |
| listsession | ListSessions       | listsession is the list of sessions  | OUT  | yes      |

#### Description

The listSessions() function allows the user to get an object which encapsulates the list of the sessions objects or one session according to the options selected

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name                     | Description                                       |
|--------------------------|---|
| VISHNU_OK                | The command completed successfully                |
| NO_ADMIN                 | The user is not an administrator                  |
| UNKNOWN_LOGIN            | The login is unknown                              |
| UNKNOWN_SESSION_OPTION   | the name of the session option is unknown         |
| SESSIONKEY_EXPIRED       | The sessionKey is expired. The session is closed. |
| SESSIONKEY_NOT_FOUND     | The sessionKey is unregonized                     |
| INCORRECT_DATE_OPTION    | The date option is incorrect                      |
| DB_ERROR                 | A problem occurs with the database                |

# **Chapitre 3**

# API specification for Tasks Management System (TMS)

# 3.1 Definition of the functions of the API

### 3.1.1 submitJob

#### **Parameters**

| Parameter      | Type          | Description   | Mode | Required |
|----------------|---------------|---|------|----------|
| sessionKey     | string        | The sessionKey is the identifier of the session generated by VISHNU   | IN   | yes      |
| machineId      | string        | Is the id of the machine where the job must be submitted.   | IN   | yes      |
| scriptFilePath | string        | The path to the file containing the characteristics (job command, and batch scheduler directive required or optional) of the job to submit.   | IN   | yes      |
| jobId          | string        | Is the returned id of the submitted job.  | OUT  | yes      |
| jobPath        | string        | Is the path to the file containing job characterics.  | OUT  | yes      |
| options        | SubmitOptions | Is an instance of the class SubmitOptions. Each optionnal value is associated to a set operation (e.g: setNbCpu()) in the class SubmitOptions. If no set operation is not called on the instance object options, the job is submitted with the options defined in the job_cmd_path. Otherewise the job is submitted with the optionnal values set by the options object and optionnal values defined in the job_cmd_path, but optionnal values set by SubmitOptions object take precedence over those in job_cmd_path. With in the object options or within the job_cmd_path, the last occurance of an optionnal value takes precedence over earlier occurance. | IN   | no       |

#### Description

The submitJob() function submits job on a machine through the use of a script (job\_cmd\_path). The script is a shell script which will be executed by a command shell such as sh or csh. The object opt parameter of this function allows the user to specifie job characterisques options. Also the user can options in the script file.

## Return Value

| Name                                | Description   |  |
|-------------------------------------|---|--|
| VISHNU_OK                           | The service was performed successfully.                           |  |
| TMS_UNKNOWN_MACHINE                 | The machine is not known.   |  |
| TMS_BATCH_SCHEDULER_ERROR           | Indicates an error caused by the underlying batch scheduler       |  |
| TMS INVALID PATH                    | The path to the file containing the characteristics of the job to |  |
| TMS_INVALID_FATTI                   | submit is not a valid path  |  |
| TMS_INVALID_RESPONSE                | Indicates that the implementation produced a response that does   |  |
| TMS_IN VALID_RESTONSE               | not match the criteria defined by the specification.              |  |
| TMS_INVALID_REQUEST                 | Indicates that the request is not valid.                          |  |
| TMS_INVALID_SESSION_KEY             | The session key is not valid to perform the service.              |  |
| TMS PERMISSION DENIED               | Indicates the requested operation is not allowed for provided     |  |
| TWIS_I ERWISSION_DENIED             | user.   |  |
| TMS_SERVER_NOT_AVAILABLE            | Indicates that the task management server is not available.       |  |
| TMS SUBMIT SERVICE NOT AVAILABLE    | Indicates that the service to perform the submit operation is not |  |
| TWIS_SODIVITI_SERVICE_NOT_AVAILABLE | found.  |  |
| TMS_UNKNOWN_BATCH_SCHEDULER_TYPE    | Indicates that the batch scheduler type is not known.             |  |
| TMS_UNKNOWN_QUEUE                   | Indicates that the specified queue by the user is not known.      |  |

int **submitJob**(const string& sessionKey, const string& machineId, const string& scriptFilePath, string& jobId, string& jobPath, const SubmitOptions& options=SubmitOptions());

# 3.1.2 listJobs

#### **Parameters**

| Parameter  | Туре            | Description   | Mode | Required |
|------------|-----------------|---|------|----------|
| sessionKey | string          | The sessionKey is the identifier of the session generated by VISHNU | IN   | yes      |
| machineId  | string          | Machine hash key  | IN   | yes      |
| listOfJobs | ListJobs        | The constructed object list of jobs                                 | OUT  | yes      |
| options    | ListJobsOptions | Additional options for jobs listing                                 | IN   | no       |

# Description

The listJobs() function gets a list of all submitted jobs

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name                             | Description   |
|----------------------------------|---|
| TMS_BATCH_SCHEDULER_ERROR        | Indicates an error caused by the underlying batch scheduler     |
| TMS_INVALID_RESPONSE             | Indicates that the implementation produced a response that does |
| TWIS_IN VALID_RESI ONSE          | not match the criteria defined by the specification.            |
| TMS_INVALID_REQUEST              | Indicates that the request is not valid.                        |
| TMS_INVALID_SESSION_KEY          | The session key is not valid to perform the service.            |
| TMS_PERMISSION_DENIED            | Indicates the requested operation is not allowed for provided   |
| TMS_LERMISSION_DENIED            | user.   |
| VISHNU_OK                        | The service was performed successfully.                         |
| TMS_SERVER_NOT_AVAILABLE         | Indicates that the task management server is not available.     |
| TMS_UNKNOWN_BATCH_SCHEDULER_TYPE | Indicates that the batch scheduler type is not known.           |
| TMS_UNKNOWN_MACHINE              | The machine is not known.                                       |

|----------------------|-------------|--|
| Name                 | string      | Assigns a job name. The default is the name of job path. |
| priority             | JobPriority | Assigns priority of the job.                             |
| queue                | string      | Assigns the queue or class of the job.                   |
| wallTime in          | int         | The maximum wall-clock time during which the job can     |
| wantime              | IIIt        | run.   |
| memory               | int         | The size of memory that the job will use.                |
| nbCpu                | int         | The number of cpu that the job will use.                 |
| nbNodesAndCpuPerNode | int         | The number of nodes and processors per node.             |

| Name       | Type   | Description                               |
|------------|--------|---|
| OutPutPath | string | Assigns the path and file for job output. |
| ErrorPath  | string | Assigns the path and file for job error.  |

# **JobPriority Enumeration Type**

| Name      | Value |
|-----------|-------|
| VERY_LOW  | 100   |
| LOW       | 200   |
| NORMAL    | 300   |
| HIGH      | 400   |
| VERY_HIGH | 500   |

# **ListJobs Class Content**

| Name          | Type  | Description  |
|---------------|---|--|
| nbJobs        | long Represents the total number of jobs in the list. |  |
| nbRunningJobs | long  | Represents of running jobs in the list.                  |
| nbWaitingJobs | long  | Represents the total number of waiting jobs in the list. |
| jobs          | List of Job   | Is a list of job information (jobId, jobName,).          |

# **Job Class Content**

| Name                 | Type        | <b>Description</b>   |
|----------------------|-------------|--|
| sessionId            | string      | Is the id of the session that contained the job submission command       |
| submitMachineId      | string      | Is the id of the machine on which the job has been submitted.            |
| submitMachineName    | string      | Is the name of the machine on which the job has been submitted.          |
| jobId                | string      | Represents the id to job.  |
| jobName              | string      | Represents the name assigned to the job.                                 |
| jobPath              | string      | Is the path to the file containing job characteristics.                  |
| outputPath           | string      | Is the path to the job output results.                                   |
| errorPath            | ataina      | Is the path to the file containing errors occurred during                |
| errorpath            | string      | job's execution.   |
| jobPrio              | JobPriority | Represents the job priority.   |
| nbCpus               | int         | Is the number of cpu used by the job.                                    |
| jobWorkingDir        | string      | Indicates the directory where the job has been launched.                 |
| status               | JobStatus   | The current status of the job.   |
| submitDate           | long        | Date and time when job was submitted (unix timestamp)                    |
| endDate              | long        | Represents the execution end date of the job (unix timestamp)            |
| owner                | string      | Represents the job owner.  |
| jobQueue             | string      | Is the name of the queue or class associated to the job.                 |
| wallClockLimit       | long        | Is the maximum wall-clock time during which the job can run (in seconds) |
| groupName            | string      | Represents the job owner group name.                                     |
| jobDescription       | string      | Is the textual description of the job.                                   |
| memLimit             | int         | Represents the memory size limit of the job.                             |
| nbNodes              | int         | Is the total number of nodes used by the job.                            |
| nbNodesAndCpuPerNode | int         | Is the number of nodes and processors per node used by the job.          |

# **JobStatus Enumeration Type**

| Name          | Value |
|---------------|-------|
| RUNNING       | 0     |
| WAITING       | 1     |
| COMPLETED     | 2     |
| CANCELED      | 3     |
| HELD          | 4     |
| QUEUED        | 5     |
| FAILED        | 6     |
| NOT_SUBMITTED | 7     |

# **ListJobsOptions Class Content**

| Name           | Type   | Description   |  |
|----------------|--|---|--|
| JobId          | string   | To list job which has this id.                        |  |
| nbCpu          | int  | To list jobs which have this number of cpu.           |  |
| fromSubmitDate | long   | List jobs submitted after this date (unix timestamp). |  |
| toSubmitDate   | long   | List jobs submitted before this date (unix timestamp) |  |
| owner          | string   | string To list all jobs submitted by this owner.      |  |
| status         | JobStatus  | To list jobs which have this status.                  |  |
| priority       | JobPriority  | To list jobs which have this priority                 |  |
| OutPutPath     | string Gets the path and file for each job output. |   |  |
| ErrorPath      | string Gets the path and file for each job error.  |   |  |
| queue          | string   | To list jobs which have this queue name.              |  |

# ListJobResults Class Content

| Name    | Type              | <b>Description</b>                             |
|---------|-------------------|--|
| nbJobs  | string            | Is the number of jobs.                         |
| Results | List of JobResult | Represents the list of completed jobs results. |

# **JobResult Class Content**

| Name       | Type   | Description   |
|------------|--------|---|
| jobId      | string | Represents the id of the job.   |
| outputPath | string | Is the path to the job output results.                                    |
| errorPath  | string | Is the path to the file containing errors occured during job's execution. |

# **ListQueues Class Content**

| Name     | Type          | Description                      |
|----------|---------------|----------------------------------|
| nbQueues | int           | Represents the number of queues. |
| queues   | List of Queue | Represents the list of queues.   |

# **Queue Class Content**

| Name       | Type   | Description                                       |  |
|------------|--------|---|--|
| name       | string | Is the queue name.                                |  |
| maxJobCpu  | int    | Is the maximum number of Cups that a job can use. |  |
| maxProcCpu | int    | Is the maximum number of Cpus of the queue.       |  |
| memory     | int    | Represents the queue memory size.                 |  |

| Name          | Type          | Description                                  |
|---------------|---------------|--|
| wallTime      | long          | Is the total wallTime of the queue.          |
| node          | int           | Is the maximum number of nodes of the queue. |
| nbRunningJobs | int           | Is the total running jobs in the queue.      |
| nbJobsInQueue | int           | Is the total number of jobs in the queue.    |
| state         | QueueStatus   | Is the status of the queue.                  |
| priority      | QueuePriority | Represents the priority of the queue.        |
| description   | string        | Is the queue description.                    |

# **QueueStatus Enumeration Type**

| Name          | Value |
|---------------|-------|
| STARTED       | 0     |
| RUNNING       | 1     |
| NOT_STARTED   | 2     |
| NOT_AVAILABLE | 3     |

# **QueuePriority Enumeration Type**

| Name      | Value |
|-----------|-------|
| VERY_LOW  | 0     |
| LOW       | 1     |
| NORMAL    | 2     |
| HIGH      | 3     |
| VERY_HIGH | 4     |

# **Progression Class Content**

| Name      | Type      | Description                                     |
|-----------|-----------|---|
| jobId     | string    | Represents the job id.                          |
| jobName   | string    | Represents the job name.                        |
| wallTime  | int       | Represents the job wall time.                   |
| startTime | long      | Start date and time of the job (unix timestamp) |
| endTime   | long      | End date and time of the job (unix timestamp)   |
| percent   | double    | Represent the job progression.                  |
| status    | JobStatus | Represents the job status.                      |

# **ProgressOptions Class Content**

| Name     | Type   | <b>Description</b>   |
|----------|--------|--|
| jobId    | string | Represents the id of the job that the user wants to see its progression. |
| jobOwner | string | Represents the owner of the job.   |

# **Chapitre 4**

# API specification for Information Management System (IMS)

# 4.1 Definition of the functions of the API

# 4.1.1 getUpdateFrequency

#### **Parameters**

| Parameter  | Type   | Description   | Mode | Required |
|------------|--------|---|------|----------|
| sessionKey | string | The key of the session of the user that submits the command | IN   | yes      |
| freq       | int    | Frequency the data are updated, in second                   | OUT  | yes      |

#### Description

The getUpdateFrequency() function gets the update frequency of the IMS database

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### **Signature**

int getUpdateFrequency(const string& sessionKey, int& freq);

# **4.1.2** export

| Parameter     | Type       | Description   | Mode | Required |
|---------------|------------|---|------|----------|
| sessionKey    | string     | The key of the session of the user that submits the command (current session key) | IN   | yes      |
| oldSessionKey | string     | The key of the session to export (session has ended)                              | IN   | yes      |
| exportType    | ExportType | The format to export  | IN   | yes      |
| filename      | string     | The file containing the commands  | OUT  | yes      |

The export() function exports all the commands made by a user during a session

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### **Signature**

int **export**(const string& sessionKey, const string& oldSessionKey, const ExportType& exportType, string& filename);

# **4.1.3** replay

#### **Parameters**

| Parameter  | Type       | Description   | Mode | Required |
|------------|------------|---|------|----------|
| sessionKey | string     | The key of the session of the user that submits the command | IN   | yes      |
| filename   | string     | A file containing the commands to replay                    | IN   | yes      |
| type       | ExportType | The type of the script to execute (python, shell)           | IN   | yes      |

#### Description

The replay() function replays a script of VISHNU commands

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | <b>Description</b>             |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### **Signature**

int **replay**(const string& sessionKey, const string& filename, const ExportType& type);

# 4.1.4 getMetricVal

#### **Parameters**

| Parameter  | Type       | Description   | Mode | Required |
|------------|------------|---|------|----------|
| sessionKey | string     | The key of the session of the user that submits the command | IN   | yes      |
| machineId  | string     | The id of the machine                                       | IN   | yes      |
| startTime  | long       | The start time to look for the metric                       | IN   | yes      |
| endTime    | long       | The end time to search                                      | IN   | yes      |
| metricType | MetricType | The metric types  | IN   | yes      |
| res        | ListMetric | A list of corresponding results                             | OUT  | yes      |

#### Description

The getMetricVal() function gets data from a metric

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### **Signature**

int **getMetricVal**(const string& sessionKey, const string& machineId, const long& startTime, const long& endTime, const MetricType& metricType, ListMetric& res);

# 4.1.5 getCurrentData

#### **Parameters**

| Parameter  | Туре       | Description   | Mode | Required |
|------------|------------|---|------|----------|
| sessionKey | string     | The key of the session of the user that submits the command | IN   | yes      |
| machineId  | string     | The id of the machine the user wants the total diskSpace    | IN   | yes      |
| dataType   | MetricType | The type of data the user wants to get                      | IN   | yes      |
| res        | double     | The total diskSpace on the machine                          | OUT  | yes      |

#### Description

The getCurrentData() function gets data corresponding to the datatype on a machine

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    |  | Description                    |
|---------|--|--------------------------------|
| SUCCESS |  | Error code returned if success |

#### Signature

int **getCurrentData**(const string& sessionKey, const string& machineId, const MetricType& dataType, double& res);

# 4.1.6 getProcesses

#### **Parameters**

| Parameter  | Type          | Description   | Mode | Required |
|------------|---------------|---|------|----------|
| sessionKey | string        | The key of the session of the user that submits the command | IN   | yes      |
| machineId  | string        | The id of the machine the user wants the running processes  | IN   | yes      |
| process    | ListProcesses | The list of the processes on the machine                    | OUT  | yes      |

#### Description

The getProcesses() function gets the list of the processes running over a front machine

#### **Return Value**

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

int **getProcesses**(const string& sessionKey, const string& machineId, ListProcesses& process);

# 4.1.7 setSystemThreshold

#### **Parameters**

| Parameter    | Type       | Description   | Mode | Required |
|--------------|------------|---|------|----------|
| sessionKey   | string     | The key of the session of the user that submits the command   | IN   | yes      |
| machineId    | string     | The id of the machine the user wants to set the treshold over | IN   | yes      |
| tresholdType | MetricType | The type of the metric to set                                 | IN   | yes      |
| value        | double     | The treshold value  | IN   | yes      |

#### Description

The setSystemThreshold() function sets a threshold on a machine of a system

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### Signature

int **setSystemThreshold**(const string& sessionKey, const string& machineId, const MetricType& tresholdType, const double& value);

# 4.1.8 getSystemThreshold

#### **Parameters**

| Parameter  | Type       | Description   | Mo <mark>de</mark> | Required |
|------------|------------|---|--------------------|----------|
| sessionKey | string     | The key of the session of the user that submits the command   | IN                 | yes      |
| machineId  | string     | The id of the machine the user wants to get the treshold over | IN                 | yes      |
| type       | MetricType | The treshold type desired                                     | IN                 | yes      |
| value      | double     | The treshold value  | OUT                | yes      |

#### Description

The getSystemThreshold() function gets a System threshold on a machine

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### **Signature**

int getSystemThreshold(const string& sessionKey, const string& machineId, const MetricType& type, double& value);

#### 4.1.9 defineUserIdentifier

#### **Parameters**

| Parameter  | Type   | Description   | Mode | Required |
|------------|--------|---|------|----------|
| sessionKey | string | The key of the session of the user that submits the command | IN   | yes      |
| format     | string | The new format to use                                       | IN   | yes      |

#### **Description**

The defineUserIdentifier() function defines the shape of the identifiers automatically generated for the users

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### **Signature**

int **defineUserIdentifier**(const string& sessionKey, const string& format);

# 4.1.10 defineMachineIdentifier

#### **Parameters**

| Parameter  | Type   | <b>Description</b>  | Mode | Required |
|------------|--------|---|------|----------|
| sessionKey | string | The key of the session of the user that submits the command | IN   | yes      |
| format     | string | The new format to use                                       | IN   | yes      |

#### Description

The defineMachineIdentifier() function defines the shape of the identifiers automatically generated for the machines

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### **Signature**

 $int \ \textbf{define} \textbf{Machine} \textbf{Identifier} (const \ string \& \ session Key, \ const \ string \& \ format) \ ;$ 

#### 4.1.11 defineJobIdentifier

| Parameter  | Type   | Description   | Mode | Required |
|------------|--------|---|------|----------|
| sessionKey | string | The key of the session of the user that submits the command | IN   | yes      |
| format     | string | The new format to use                                       | IN   | yes      |

The defineJobIdentifier() function defines the shape of the identifiers automatically generated for the jobs

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### Signature

int defineJobIdentifier(const string& sessionKey, const string& format);

#### 4.1.12 defineTransferIdentifier

#### **Parameters**

| Parameter  | Type   | <b>D</b> escription   | Mode | Required |
|------------|--------|---|------|----------|
| sessionKey | string | The key of the session of the user that submits the command | IN   | yes      |
| format     | string | The new format to use                                       | IN   | yes      |

#### **Description**

The defineTransferIdentifier() function defines the shape of the identifiers automatically generated for the file transfers

# Return Value

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |  |
|---------|--------------------------------|--|
| SUCCESS | Error code returned if success |  |

#### **Signature**

int defineTransferIdentifier(const string& sessionKey, const string& format);

#### 4.1.13 loadShed

#### **Parameters**

| Parameter    | Type         | Description   | Mode | Required |
|--------------|--------------|---|------|----------|
| sessionKey   | string       | The key of the session of the user that submits the command | IN   | yes      |
| machineId    | string       | The id of the machine to stop                               | IN   | yes      |
| loadShedType | LoadShedType | Type of load shedding                                       | IN   | yes      |

#### **Description**

The loadShed() function loads shed a machine, 2 modes are available, soft or hard. Soft flushes the machine, hard stops the

#### machine

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### **Signature**

int loadShed(const string& sessionKey, const string& machineId, const LoadShedType& loadShedType);

# 4.1.14 setUpdateFrequency

#### **Parameters**

| Parameter  | Type   | Description   | Mode | Required |
|------------|--------|---|------|----------|
| sessionKey | string | The key of the session of the user that submits the command | IN   | yes      |
| freq       | int    | Frequency the data are updated, in second                   | IN   | yes      |

#### **Description**

The setUpdateFrequency() function sets the update frequency of the IMS tables

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    |  | Description                    |
|---------|--|--------------------------------|
| SUCCESS |  | Error code returned if success |

#### Signature

int setUpdateFrequency(const string& sessionKey, const int& freq);

# 4.1.15 notifyOverflow

#### **Parameters**

| Parameter | Type   | Description                            | Mode | Required |
|-----------|--------|--|------|----------|
| machineId | string | The id of the machine with an overflow | IN   | yes      |
| message   | string | The message to send                    | IN   | yes      |

#### Description

The notifyOverflow() function sends a mail to the admin responsible for the limite whose treshold has been reached

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### Signature

int notifyOverflow(const string& machineId, const string& message);

#### 4.1.16 restart

#### **Parameters**

| Parameter    | Type        | Description   | Mode | Required |
|--------------|-------------|---|------|----------|
| sessionKey   | string      | The key of the session of the user that submits the command | IN   | yes      |
| type         | RestartType | The type of restart desired                                 | IN   | yes      |
| componentNam | ne string   | If not restarting all, the name of the component to restart | IN   | no       |

#### Description

The restart() function restarts the whole VISHNU infrastructure. Actions are saved and restarted from the beginning once the infrastructure has been restarted

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### Signature

int restart(const string& sessionKey, const RestartType& type, const string& componentName);

# 4.1.17 updateMachine

#### **Parameters**

| Parameter    | Type         | Description   | Mode | Required |
|--------------|--------------|---|------|----------|
| sessionKey   | string       | The key of the session of the user that submits the command | IN   | yes      |
| machineId    | string       | The id of the machine to update                             | IN   | yes      |
| CompoMachine | CompoMachine | A description of the type of component to change            | IN   | yes      |
| val          | object       | The value to set  | IN   | yes      |
| lang         | string       | For machine description, the language used                  | IN   | no       |

#### Description

The updateMachine() function updates the machines information in the database (diskspace and memory)

#### **Return Value**

An error code is returned when an error occurs during the execution of the function.

| Name    | Description                    |
|---------|--------------------------------|
| SUCCESS | Error code returned if success |

#### Signature

int **updateMachine**(const string& sessionKey, const string& machineId, const CompoMachine& CompoMachine, const object& val, const string& lang);

# 4.2 Class definitions
