# **Chapter 1**

# Document presentation

### 1.1 Document objectives

This document presents the external specifications of the Vishnu system at a general level. At this level, we describe the interaction of a user with the system without providing implementation details. The different steps that make the scenario are detailed as well as the content of the messages exchanged. The main objective is to describe the system from the user point of view.

These general specifications are a prerequisite for the detailed specification step in the software development process.

### 1.2 Document structure

The document is divided into 4 parts corresponding to the 4 modules that compose the Vishnu system:

- UMS: Users Management System
- TMS: Tasks Management System
- FMS: Files Management System
- IMS: Information Management System

Each module corresponds to a chapter in the document, and each chapter contains two sections:

- A first section containing "Use case description" that follow the standard UML description of a use case
- A second section containing the "Use case diagrams" that describe the organization of the different use cases. These diagrams follow the UML2.0 standard.

## 1.4 Glossary

# **Chapter 2**

# Use cases for Users Management System (UMS)

## 2.1 Use case descriptions

#### 2.1.1 U1 - Session with manual closure

Title	U1 - Session with manual closure
Summary	User opens a new session and closes it manually
Actors	User
Precondition	- the user is authentificated
riccollation	- VISHNU is installed and running on the client system
	- the session state is closed
Postcondition	- a session log has been created
Postcolidition	- all user requests submitted within the session are
	complete
	1. include::U1.1 Open session
	2. System is ready to process user commands
Base sequence	3. include::U1.2 Close session (before the maximum
	inactivity delay if option CLOSE_POLICY is equal to
	CLOSE_ON_TIMEOUT)
Branch sequence	2a. U1.3 Execute user command
	1a. include::U1.1 exceptions
Enantian armana	3a. if session cannot be closed due to running command,
Exception sequence	user must wait until all commands are completed before
	trying step 3 again
	U1.4 - Execute synchronous user request
Extensions	U1.6 - Reconnect to session
	U1.5 - Execute asynchronous user request

### 2.1.2 **U1.1 - Open session**

Title	U1.1 - Open session
Summary	User opens a session
Actors	User
	- User is connected on a client host on which vishnu is
Precondition	installed and that can be connected to the vishnu
	infrastructure

- the user's environment contains a session certificate  1. User provides login and password to the "connect" command 2. System validates login and password (User is authentificated) 3. System creates the session and activates it 4. System provides the session certificate to the user  2a. If the password is a temporary password (after reset by the Admin) the System asks the User to enter a new password, then ask for a confirmation, and registers the new password if both steps are ok. If non-interactive request then this is an exception (a change password request is required).  2a. user login is unknown 2a1. system returns an error message 2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c. user account is blocked 2c1. the system returns an error message		 
Base sequence  1. User provides login and password to the "connect" command 2. System validates login and password (User is authentificated) 3. System creates the session and activates it 4. System provides the session certificate to the user  2a. If the password is a temporary password (after reset by the Admin) the System asks the User to enter a new password, then ask for a confirmation, and registers the new password if both steps are ok. If non-interactive request then this is an exception (a change password request is required).  2a. user login is unknown 2a1. system returns an error message 2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c. user account is blocked 2c1. the system returns an error message	Postcondition	- a session is active
Base sequence  2. System validates login and password (User is authentificated) 3. System creates the session and activates it 4. System provides the session certificate to the user 2a. If the password is a temporary password (after reset by the Admin) the System asks the User to enter a new password, then ask for a confirmation, and registers the new password if both steps are ok. If non-interactive request then this is an exception (a change password request is required).  2a. user login is unknown 2a1. system returns an error message 2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c. user account is blocked 2c1. the system returns an error message		
Base sequence  2. System validates login and password (User is authentificated) 3. System creates the session and activates it 4. System provides the session certificate to the user  2a. If the password is a temporary password (after reset by the Admin) the System asks the User to enter a new password, then ask for a confirmation, and registers the new password if both steps are ok. If non-interactive request then this is an exception (a change password request is required).  2a. user login is unknown 2a1. system returns an error message 2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c. user account is blocked 2c1. the system returns an error message		
authentificated)  3. System creates the session and activates it  4. System provides the session certificate to the user  2a. If the password is a temporary password (after reset by the Admin) the System asks the User to enter a new password, then ask for a confirmation, and registers the new password if both steps are ok. If non-interactive request then this is an exception (a change password request is required).  2a. user login is unknown  2a1. system returns an error message  2b. user password is invalid  2b1. system returns an error message  2b2. if nb of login failures < max nb, the system increments the login failures counter for the user  2b3. if nb of login failures = max nb, the system sets the user account as blocked  2c. user account is blocked  2c1. the system returns an error message		
Branch sequence  Description sequence  Branch sequence  Branch session and activates it  4. System prevales session and activates it  4. System peassword is a temporary password (after reset by the Admin) the System sets the user password if both steps are ok. If non-interactive request then this is an exception (a change password request is required).  2a. user login is unknown  2a1. system returns an error message  2b. user password is invalid  2b1. system returns an error message  2b2. if nb of login failures < max nb, the system increments the login failures counter for the user  2b3. if nb of login failures = max nb, the system sets the user account as blocked  2c. user account is blocked  2c. user account is blocked  2c1. the system returns an error message	Rase sequence	
4. System provides the session certificate to the user  2a. If the password is a temporary password (after reset by the Admin) the System asks the User to enter a new password, then ask for a confirmation, and registers the new password if both steps are ok. If non-interactive request then this is an exception (a change password request is required).  2a. user login is unknown 2a1. system returns an error message 2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c. user account is blocked 2c1. the system returns an error message	base sequence	
Branch sequence  2a. If the password is a temporary password (after reset by the Admin) the System asks the User to enter a new password, then ask for a confirmation, and registers the new password if both steps are ok. If non-interactive request then this is an exception (a change password request is required).  2a. user login is unknown 2a1. system returns an error message 2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c1. the system returns an error message		
the Admin) the System asks the User to enter a new password, then ask for a confirmation, and registers the new password if both steps are ok. If non-interactive request then this is an exception (a change password request is required).  2a. user login is unknown 2a1. system returns an error message 2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c1. the system returns an error message		
Branch sequence  password, then ask for a confirmation, and registers the new password if both steps are ok. If non-interactive request then this is an exception (a change password request is required).  2a. user login is unknown 2a1. system returns an error message 2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c1. the system returns an error message		2a. If the password is a temporary password (after reset by
new password if both steps are ok. If non-interactive request then this is an exception (a change password request is required).  2a. user login is unknown 2a1. system returns an error message 2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c1. the system returns an error message		the Admin) the System asks the User to enter a new
request then this is an exception (a change password request is required).  2a. user login is unknown 2a1. system returns an error message 2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c1. the system returns an error message	Branch sequence	
request is required).  2a. user login is unknown  2a1. system returns an error message  2b. user password is invalid  2b1. system returns an error message  2b2. if nb of login failures < max nb, the system  increments the login failures counter for the user  2b3. if nb of login failures = max nb, the system sets the  user account as blocked  2c. user account is blocked  2c1. the system returns an error message	Branch sequence	
2a. user login is unknown 2a1. system returns an error message 2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c1. the system returns an error message		
2a1. system returns an error message 2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c1. the system returns an error message		
2b. user password is invalid 2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c1. the system returns an error message		
2b1. system returns an error message 2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c1. the system returns an error message		
Exception sequence  2b2. if nb of login failures < max nb, the system increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c1. the system returns an error message		
Exception sequence  increments the login failures counter for the user 2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c1. the system returns an error message		
Exception sequence  2b3. if nb of login failures = max nb, the system sets the user account as blocked 2c. user account is blocked 2c1. the system returns an error message		
user account as blocked 2c. user account is blocked 2c1. the system returns an error message		
2c. user account is blocked 2c. the system returns an error message	Exception sequence	
2c1. the system returns an error message	Exception sequence	user account as blocked
2d vishnu infrastructure is unreachable or unavailable		
2d. Visinia initiastractare is unreachable of unavailable		2d. vishnu infrastructure is unreachable or unavailable
2d1. the system returns an error message		
2e. user password is temporary and request is		
non-interactive: the System returns an error message		non-interactive: the System returns an error message

### 2.1.3 U1.2 - Close session

Title	U1.2 - Close session				
Summary	User closes the session manually				
Actors	User				
Precondition	- the User is connected on the client system				
1 recondition	- the User has an open session on the client system				
	- the session is closed				
Postcondition	- a session log has been created				
Postcondition	- all user requests submitted during the session are				
	complete				
	1. the system checks that there are no running commands				
Daga gaguanga	within the session				
Base sequence	2. the system closes the session				
	3. the system informs the user that the session was closed				
Branch sequence					
Exception sequence	1a. If there are running commands within the session, the				
Exception sequence	system informs the user that the session can not be closed				

### 2.1.4 U1.4 - Execute synchronous user request

Title	U1.4 - Execute synchronous user request
Summary	User submits a synchronous request to the system
Actors	User
Precondition	- a session (for the current user and client host) is active

Postcondition	- the request is completed
rostcondition	- a request log is created
Paga gaguanga	1. User sends the request to the system
Base sequence	2. System returns the results to the user
Branch sequence	
	Invalid session (bad session certificate or unavailable
	session)
Exception sequence	Invalid request
Exception sequence	Permission denied (admin request issued by normal user)
	Ressource not available
	VISHNU system crashed
	U1 - Session with manual closure
Extension of	U3 - Session with automatic closure on disconnect
	U2 - Session with automatic closure on timeout

## 2.1.5 U1.4.1 - Configure Option

Title		U1.4.1 - Configure Option
Cummany		The user wants to modify the value of an option attached to
Summary		his/her VISHNU account
Actors	7	User
Precondition		
Postcondition		
		1. User sends a request for modifying the value of an
Pasa saguanca		option to the system
Base sequence		2. System registers the new value for the option
		3. System returns an acknowledgment to the user
Branch sequence		
Exception sequence		2a. Invalid option name
Exception sequence		2b. Invalid option value

### 2.1.6 U1.4.2 - Display sessions log

Title	U1.4.2 - Display sessions log
Summary	The user displays its sessions (active or closed)
Actors	User
Precondition	
Postcondition	
Base sequence	- User sends a request to list all his/her sessions (active and/or closed) - System returns all (or only active, or only closed) sessions of the user with the following information for each session: id, date of opening, client host name, closure policy (timeout or disconnect), time before automatic closure (if applicable)
Branch sequence	
Exception sequence	

### 2.1.7 U1.4.3 - Change password

Title	U1.4.3 - Change password
Summary	The user wants to change his/her password

Actors	User
Precondition	
Postcondition	- the password is changed
	- User sends a request containing a new password
Base sequence	- System registers the new user's password
	- System returns an acknowledgment to the User
Branch sequence	
Exception sequence	

### 2.1.8 U1.4.4 - Display Session command history

Title	U1.4.4 - Display Session command history
Summary	the user displays all the commands sent during one session
Actors	
Precondition	
Postcondition	
Base sequence	1 - User sends a request containing the session ID 2 - System returns the list of all commands issued by the user during the session which ID corresponds to the provided session ID. Each command has exactly the same format and parameters as the original submission and can be resubmitted as-is to the System.
Branch sequence	
Exception sequence	2a - Invalid session ID (unknown / belonging to another user, if the current user is not an Admin)

# **Chapter 3**

# Use cases for Tasks Management System (TMS)

## 3.1 Use case descriptions

#### 3.1.1 U2.1-SubmitJob

Title		U2.1-SubmitJob
Summary		User submits a job
Actors		User
		- User has a valid session Id
Precondition		- The machine to submit the job is available
		- The job is submitted on the specified machine.
Postcondition		The job state and id are recorded on the system's log.
Tosteonation		The job id is sent to the user
		1 The path contatining the characteristics of the job is
		verified
		2. The TMS server on the given machine is contacted
Base sequence		3. The session id is ckecked by the TMS server
		4. The job is submited by the TMS server to the batch
		scheduler
		5. The id of the submited job is returned to the user.
		1a. The path containing the characteristics of the job is not
		found
		- The system prints an error message that informs
		- The user revises the path
		- The UserCase goes to the action 1
		2a The name of the given machine is unknown
Branch sequence		-The system prints an error message that informs the user
Branen sequence		-The UserCase goes to the action 2 of the base
		sequence.
	3a The session id is not valid	
		- The system prints an error message that informs the user.
		- The user revises the id.
		- The UserCase goes to the action 3 of the base
		sequence.
Exception sequence		1a The TMS server is unavailable
		- The system returns an error message

### 3.1.2 U2.2-GetJob

Title		U2.2-GetJob
Summary		User requests the TMS server for getting some
		informations of a specific job
Actors		User
Precondition		- User has a valid session id
		- The user receives all features of a specific job
Postcondition		- The system registers all job informations in the system's
		log
		1. The system checks the session id
Base sequence		2. The systems checks the job id
		3. The user receives all features of a specific job
		1a. The session id is not a valid id
		- The system prints an error message that informs the user.
		- The user revises the id.
		- The UserCase goes to the action 1 of the base
		sequence.
		1a The job id is not a valid id
		- The system prints an error message that informs the user.
Branch sequence		- The user revises the id.
		- The UserCase goes to the action 1 of the base
		sequence.
		3a. The name of the given machine is unknown
		-The system prints an error message that informs the user
		-User gives a correct name.
		-The UserCase goes to the action 5 of the base
		sequence.
Exception sequence		1a The TMS server is unavailable
		- The system returns an error message
Extension of		U5.1-CheckSessionId

### 3.1.3 **U2.3-ListJobs**

Title	U2.3-ListJobs
Summary	User lists all jobs submitted
Actors	User
Precondition	-User has a valid session id
Postcondition	- The System sends informations on all jobs to the user - The System registers informations on all jobs in the system's log
Base sequence	<ol> <li>The TMS server on the given machine is contacted</li> <li>The session id is ckecked by the TMS server</li> <li>The System sends full information on all jobs to the user</li> </ol>
Branch sequence	1a The name of the given machine is unknown -The system prints an error message that informs the user -The UserCase goes to the action 2 of the base sequence.  2a The session id is not valid - The system prints an error message that informs the user The user revises the id The UserCase goes to the action 2 of the base sequence.

Expansion seguence	1a The TMS server is unavailable
Exception sequence	- The system returns an error message

### 3.1.4 U2.4-CancelJob

Title	U2.4-CancelJob
Summary	The user cancels a job
Actors	User
Precondition	- The user has a valid session id
Postcondition	-The job is canceled on the specified machineThe job state and id are removed to the system's logAn information is sent to the user
Base sequence	1 The system checks the session id 2. The systems checks the job id 3. The systems cancels the job
Branch sequence	1a The session id is not a valid id  The system prints an error message that informs the user.  The user revises the id.  The UserCase goes to the action 1 of the base sequence.  1a The job id is not a valid id  The system prints an error message that informs the user.  The user revises the id.  The UserCase goes to the action 1 of the base sequence.  3a. The name of the given machine is unknown  The system prints an error message that informs the user  User gives a correct name.  The UserCase goes to the action 5 of the base sequence.
Exception sequence	1a The TMS server is unavailable - The system returns an error message

### 3.1.5 U2.5-ListQueue

Title	U2.5-ListQueue
Summary	User lists all queues or classes of a specific batch scheduler
Actors	User
Precondition	-User has a valid session id
Postcondition	-The system collects the informations on each queue or
	classes.
	-The system send the list contained the informations on all
	queues to the user.
Base sequence	1. The TMS server on the given machine is contacted
	2. The session id is ckecked by the TMS server
	3. The System sends full information on all queues or
	classes to the user

Branch sequence	1a The name of the given machine is unknown -The system prints an error message that informs the user -The UserCase goes to the action 2 of the base sequence.  2a The session id is not valid - The system prints an error message that informs the user The user revises the id The UserCase goes to the action 2 of the base
	sequence.
Exception sequence	1a The TMS server is unavailable
	- The system returns an error message
